BioRadar - Officer Report

A2 - HongQimen | generated 2026-10-10 14:37

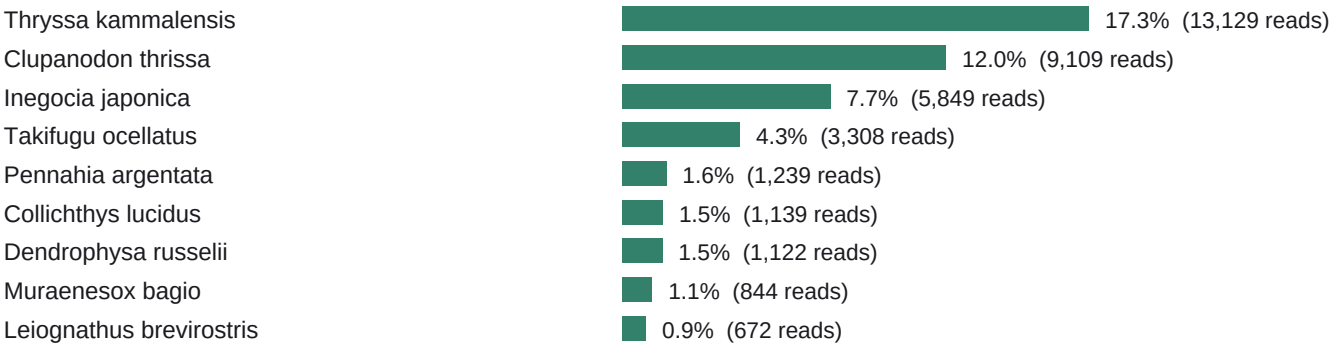
RISK LEVEL

NO INVASIVE FISH FOUND IN THIS SAMPLE

WHAT TO DO

No action needed now. Keep the normal monitoring schedule. This is not proof the water is free of invasive fish: DNA can miss animals that are rare or far away.

ANIMALS DETECTED (SHARE OF THE FISH DNA READS THAT COULD BE NAMED)



Share = reads of the animal / 75,985 reads that could be named. A share is a proportion of DNA reads, not a count of animals or their weight.

... and 12 more in the full table.

SOURCE AND SAMPLE DATE

Sample: A2 | Collected: 2019 | Place: HongQimen

Public archive: PRJNA1059782 (Real and mock estuarine fish data (12S MiFish-U)), run SRR27401753.

UNCERTAINTY AND MISSING COVERAGE

- Sample verdict: Usable. 92% of reads passed quality control.
- 30% of reads were kept as species calls, 62% are unknown or need review, 8% were dropped by quality checks.
- 3,928 different DNA fragments could not be named. They are NOT identified: each is queued for an expert to review, with its closest match shown.
- Only fish in the reference list (3,693 species) can be named. A fish that is missing from it shows up as unknown, never under a wrong name.
- Season: 58 species in summer, 56 in winter at this place; 7 only in summer, 5 only in winter. 'Not detected' does not mean absent.
