BioRadar - Officer Report

Irigation point 3 - South Kalimantan | generated 2026-10-10 14:37

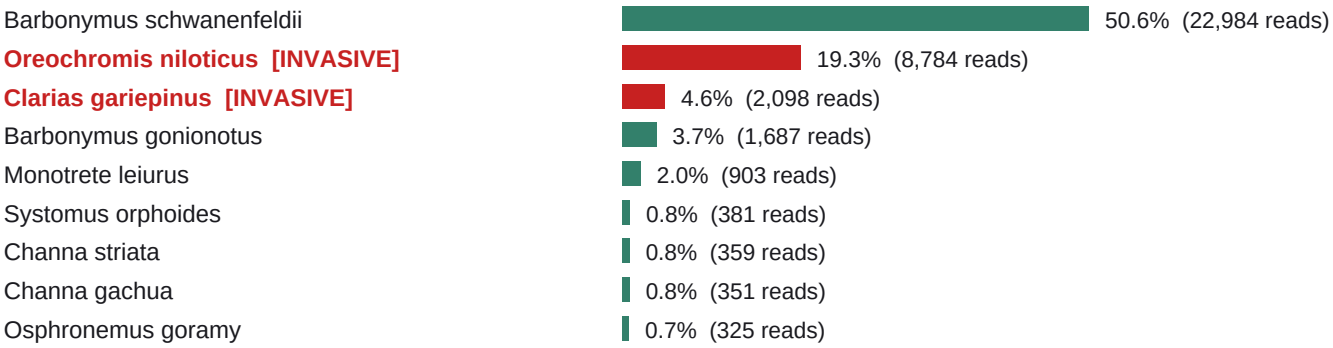
RISK LEVEL

HIGH - INVASIVE FISH DETECTED

WHAT TO DO

Plan a field check at this pin. Take a second water sample and look for the fish. Report it to the regional fisheries or forest office.

ANIMALS DETECTED (SHARE OF THE FISH DNA READS THAT COULD BE NAMED)



Share = reads of the animal / 45,443 reads that could be named. A share is a proportion of DNA reads, not a count of animals or their weight.

... and 15 more in the full table.

Possible invasive fish, NOT confirmed: Pterygoplichthys disjunctivus (not separable from Hypostomus plecostomus, Pterygoplichthys pardalis); Oreochromis niloticus (not separable from Sarotherodon galilaeus); Cyprinus carpio (not separable from Cyprinus acutidorsalis, Cyprinus pellegrini, Procypris mera).

SOURCE AND SAMPLE DATE

Sample: Irigation point 3 | Collected: 2025-08 | Place: South Kalimantan (-3.4053, 114.7900)
Public archive: PRJNA1433820 (eDNA metabarcoding of freshwater fishes, Martapura River & irrigation (12S MiFish-U)), run SRR37521672.

UNCERTAINTY AND MISSING COVERAGE

- Sample verdict: Usable with caution. 41% of reads were dropped (caution above 25%): library quality is poor, but enough remains to report.
- 17% of reads were kept as species calls, 42% are unknown or need review, 41% were dropped by quality checks.
- 7,925 different DNA fragments could not be named. They are NOT identified: each is queued for an expert to review, with its closest match shown.
- Only fish in the reference list (3,693 species) can be named. A fish that is missing from it shows up as unknown, never under a wrong name.
- Season: no summer/winter pair is available for this place, so no seasonal change can be reported.
- No published ground truth was available for this sample's species split.
