BioRadar - Site Officer Report

HongQimen | summer and winter | generated 2026-10-10 14:37

RISK LEVEL

CRITICAL - INVASIVE FISH DETECTED AT THIS SITE

WHAT TO DO

Send a field team to this pin within days to confirm the fish by net or a second water sample. Do not release or move any fish from this water until confirmed.

Where: Largemouth bass (Micropterus salmoides), seen at pin 22.0000, 113.0000.

ANIMALS DETECTED: SUMMER VS WINTER (DNA READS)

	summer / winter
Clupanodon thrissa	11,199 / 5,353
Mugil cephalus	4,080 / 11,175
Collichthys lucidus	9,442 / 3,609
Siganus guttatus	494 / 11,629
Monacanthus chinensis	1,537 / 10,381
Ambassis gymnocephalus	353 / 8,792
Squaliobarbus curriculus	4,456 / 2,860
Leiognathus brevirostris	3,850 / 2,449
Oreochromis niloticus [INVASIVE]	4,072 / 1,315
Odontamblyopus rebecca	3,318 / 1,813

58 species detected in summer, 56 in winter. 51 seen in both; 7 only in summer; 5 only in winter. 'Only in' means not detected in the other season's bottles. It does not mean absent.

SOURCE AND SAMPLE DATES

Place: HongQimen (22.0000, 113.0000). Summer: 3 sample(s) collected 2019-08. Winter: 2 sample(s) collected 2019-11.

Public archive: PRJNA1059782 (Real and mock estuarine fish data (12S MiFish-U)). Runs: SRR27401768, SRR27401767, SRR27401745, SRR27401756, SRR27401741.

UNCERTAINTY AND MISSING COVERAGE

- Sample quality - summer: Usable, Usable with caution. Winter: Usable. Reads named to a species: 24% (summer), 33% (winter); the rest were dropped by quality checks or could not be named.
- Only fish in the reference list (3,693 species) can be named. A fish missing from it appears as unknown, never under a wrong name; unknown sequences are queued for expert review.
- A season with poorer reads can show fewer species because of the data, not because of the water.
- Map pin: coordinates were deposited at 1-degree precision (22 N 113 E), so every site in this project shares one pin.
