BioRadar - Site Officer Report

Humen | summer and winter | generated 2026-10-10 14:37

RISK LEVEL

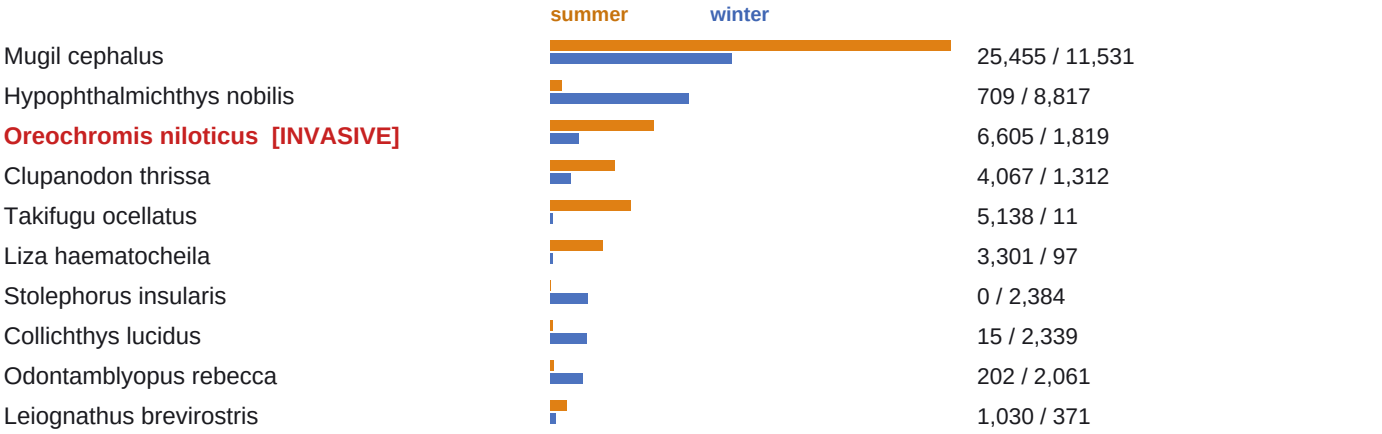
HIGH - INVASIVE FISH DETECTED AT THIS SITE

WHAT TO DO

Plan a field check at this pin. Take a second water sample and look for the fish. Report it to the regional fisheries or forest office.

Where: Nile tilapia (Oreochromis niloticus), seen at pin 22.0000, 113.0000.

ANIMALS DETECTED: SUMMER VS WINTER (DNA READS)



20 species detected in summer, 46 in winter. 17 seen in both; 3 only in summer; 29 only in winter. 'Only in' means not detected in the other season's bottles. It does not mean absent.

SOURCE AND SAMPLE DATES

Place: Humen (22.0000, 113.0000). Summer: 3 sample(s) collected 2019-08. Winter: 3 sample(s) collected 2019-11.
Public archive: PRJNA1059782 (Real and mock estuarine fish data (12S MiFish-U)). Runs: SRR27401740, SRR27401737, SRR27401766, SRR27401739, SRR27401738, SRR27401736.

UNCERTAINTY AND MISSING COVERAGE

- Sample quality - summer: Usable with caution. Winter: Usable, Usable with caution. Reads named to a species: 7% (summer), 11% (winter); the rest were dropped by quality checks or could not be named.
- Only fish in the reference list (3,693 species) can be named. A fish missing from it appears as unknown, never under a wrong name; unknown sequences are queued for expert review.
- A season with poorer reads can show fewer species because of the data, not because of the water.
- Map pin: coordinates were deposited at 1-degree precision (22 N 113 E), so every site in this project shares one pin.
